

Wave2

Publishing Platform

Automated publishing with — 

- Automatic building of editorial pages
- Structured documents from unstructured data
- Pagination of complex documents
- Brochures and sales literature

Wave2 products are all designed to make digital content work better and harder. The foundation of all of Wave2 software products is the Wave2 Publishing Platform. This is a powerful rules engine that allows us to automatically create and build documents. These documents may be in a variety of formats, for print or for electronic delivery depending upon the application.

Artemis is a new generation Automated Page Layout System for automatic creation of editorial and complex listings pages for delivery via print or electronically.

Artemis is an automated page layout system. There are many powerful commercial software applications available for automatically building pages and Artemis does just this – but more.

Artemis is different in its whole approach to page layout. Most currently available solutions are template-driven and assume structured content will be available to fill the template. Artemis is capable of handling unstructured content such as news articles, or “unpredictable” content that was not originally prepared for a particular purpose. Artemis does not need the content to fit a particular template. Once given the content, it works out how many images and individual text objects it needs to place, then decides the most appropriate way to lay these out on a page (or pages). The Wave2 rules engine embedded within Artemis takes a set of styles and rules to ensure that the result is always consistent even though the content and layout may vary considerably every time.

Applications for Artemis include automating the building of editorial pages. Creating structured documents from unstructured data and automatically paginating complex documents such as brochures and sales literature.
